

Statement of Purpose
Business Administration Master
Najran University
El Ghali Sany

A high return on investment can still be a poor decision.

I reached this conclusion while working on my final-year project on outdoor advertising profitability in Casablanca. At first, the problem looked financial: compare advertising locations, estimate costs, model revenues, and identify the best-performing sites. But the deeper I worked, the more limited a purely financial answer became. Traffic volume mattered, but so did purchasing power, regulation, urban visibility, operational costs, maintenance risk, and the credibility of the assumptions behind the model. A location could look profitable on paper and still become weak once regulatory constraints, data quality, and implementation risks were included.

That experience changed the way I think about management. I no longer see business administration as the simple coordination of people, budgets, and processes. I see it as the discipline of building defensible decisions under uncertainty.

This is why I am applying to the Master of Business Administration at Najran University. My objective is to develop the managerial, analytical, and strategic capacity required to evaluate complex transformation projects, especially AI-enabled digital transformation and smart-city initiatives in Saudi Arabia and the wider GCC region.

My academic foundation is in management, finance, and accounting. During my Bachelor's degree at the International University of Casablanca, I developed a strong base in financial analysis, management control, statistics, accounting, economics, and business law. My final project allowed me to apply this training to a real investment problem. I used traffic simulation, GIS-based spatial analysis, socio-economic indicators, and financial modelling to evaluate outdoor advertising assets in Casablanca. I built a model integrating CAPEX, OPEX, total cost of ownership, ROI, break-even analysis, and a multi-criteria profitability index.

The technical lesson was clear: investment decisions require more than isolated ratios. The intellectual lesson was more important: a manager must know how to structure incomplete information, compare alternatives transparently, and defend a recommendation in front of stakeholders who may value risk, cost, compliance, and impact differently.

My professional experiences strengthened this conviction. At 2ACOM, an advertising sales agency in Casablanca, I worked on financial and performance analysis related to advertising investment locations. This helped me understand how investment models are used in commercial decisions, not only in academic reports. At MAGHREBAIL, I gained exposure to leasing finance, client portfolio analysis, and credit-risk monitoring. More recently, at SAN MAROC, I worked on business analysis and financial performance, including non-performing loan portfolio analysis, reporting automation, and dashboard development. These experiences taught me that managerial decisions are rarely made in ideal conditions. They are made with imperfect data, operational pressure, and the need for measurable results.

This is also why my current research interests have moved toward digital transformation, AI governance, and smart-city investment readiness. In my research manuscript on AI-MCDM investment scoring for smart cities, I explored how infrastructure projects can be ranked under carbon, energy, and geoeconomic risk. The model combined forecasting, risk-adjusted valuation logic, and multi-criteria decision-making. The purpose was not to replace managerial judgment with algorithms. It was to make judgment more transparent, auditable, and robust.

My proposed research direction for the MBA at Najran University builds on this trajectory. I aim to develop an integrated MBA readiness framework for assessing AI-enabled digital transformation in Saudi smart-city megaprojects, using NEOM as a conceptual case setting. The framework would compare generic digital-transformation checklists with a more comprehensive managerial model integrating strategic alignment, ROI discipline, operational feasibility, data governance, stakeholder trust, and Islamic business ethics. I am especially interested in a practical question: how can managers decide whether an AI-enabled transformation project is not only technologically ambitious, but also financially disciplined, governable, trusted, and aligned with long-term public value?

Najran University is a logical environment for this work. The College of Business Administration's emphasis on business management, scientific research, community service, and alignment with Saudi Vision 2030 fits directly with my academic direction. I am not looking for a general MBA disconnected from context. I am looking for a program where management education is linked to national development, research culture, labour-market needs, and applied problem-solving. Saudi Arabia's transformation agenda makes this especially relevant. Vision 2030 requires managers who can evaluate projects rigorously, use technology responsibly, and translate strategic ambition into operational execution.

The MBA will allow me to strengthen several areas that are essential for my development. First, I want to deepen my understanding of strategic management, organizational change, and performance measurement. Second, I want to improve my ability to evaluate projects from both financial and operational perspectives. Third, I want to connect digital transformation with governance, ethics, and stakeholder trust. Finally, I want to build the leadership maturity required to work across technical, financial, and institutional teams.

I also bring a profile that can contribute to the program. My background combines finance, data-supported decision-making, urban investment analysis, and emerging research on smart-city scoring models. I have worked with tools and methods such as financial modelling, KPI dashboards, traffic simulation, GIS logic, multi-criteria analysis, and reporting automation. More importantly, I have learned to ask managerial questions behind technical models: Who will use this decision? What risks are hidden? Which assumptions drive the result? How can the recommendation remain credible if conditions change?

After the MBA, my goal is to work as a business analyst, strategy analyst, or digital transformation consultant focused on smart-city projects, infrastructure investment, and performance governance in Saudi Arabia, the GCC, and international development-oriented environments. In the longer term, I intend to pursue applied research or doctoral study on AI governance, investment readiness, and managerial decision frameworks for digital transformation. My ambition is to contribute to organizations that need more than digital ambition. They need disciplined evaluation, responsible governance, and measurable impact.

Najran University represents the right next step because it can help me move from analytical modelling to managerial leadership. My past work taught me how to evaluate projects. My current research taught me why governance and strategic readiness matter. The MBA will help me develop the broader executive judgment needed to lead complex decisions where finance, technology, ethics, and development priorities intersect.

I am applying because my academic and professional path has reached a clear point: I want to become the kind of manager who can make transformation projects not only innovative, but also accountable, feasible, and valuable.
